

SCOPUS

General information

Scopus is an abstract and citation database launched in 2004. It covers the fields of science, technology, medicine, social sciences, and the arts and humanities. It covers various formats of sources - Books and Book Series, Peer Reviewed Journals, Trade Journals, Conference Papers, and other formats. It is used by authors, researchers, students, librarians, universities, and a host of others.

Scopus is a subscription service. According to Scopus, it includes over 77.8 million records, 23,452 peer-reviewed journals, over 852 book series, and around 9.8 million conference papers from over 120,000 worldwide events.¹ All the material covered in the database is reviewed each year to ensure quality standards are maintained. Scopus gives four types of quality measure for each title; those are h-Index, CiteScore, SJR (SCImago Journal Rank), and Source Normalized Impact per Paper or SNIP.

Scopus offers author profiles which cover academic affiliations, number of publications and their bibliographic data, references, and details on the number of citations each document has received. It has an alert feature that allows users to track changes to a profile, as well as make changes themselves. Scopus IDs for authors are also integrated with ORCID. Since Scopus is owned by Elsevier, an independent Scopus Content Selection and Advisory Board was established to prevent a potential conflict of interest in the choice of journals to be included in the database. The board consists of scientists and subject librarians.
